
Recall 2021 R2

Release Notes

GS1 Canada is continually enhancing our services based on community business requirements and feedback from our subscribers. This document outlines enhancements in Recall 2021 R2.

This version contains some system enhancements to improve overall performance of the tool and clarity of the user interface.

As well, with this release:

- Recall Action Centre is a new, virtual assistant console developed to help you identify notifications that require action. Action Centre provides guidance on steps required to complete and close a recall notification.
For example, if an Approver receives an email message that a recall notification needs approving, the Approver can first go to Action Centre to see if another Approver has already taken that action.
- An administrator of the Initiating company can set custom reminder intervals for their receiver companies on the Settings page.
Reminder intervals start with default settings that are used by the system unless someone changes them.
